DELIVERING ENERGY EXPERTISE

Going the extra mile

↳ London-based Gnewt Cargo provides environmentally friendly logistic solutions by using small electric vans and cargo cycles to transport goods across the Capital for third party logistics companies and larger retailers, including TNT and Office Depot. After recently expanding its green fleet, Gnewt approached Energeno to explore its energy consumption.

Using Energeno's Wattson Classic, a small monitoring device that gives precise readings of electricity being used by appliances in the home, office or an industrial setting, Gnewt has been able to quantify the energy used by its vehicles per mile and the amount of electricity needed to charge its entire fleet overnight.

Nick Spencer, operations director at Gnewt Cargo who sought out the services of Energeno explains: "While our smaller vehicles are charged from a standard 240v three pin source, the larger vehicles we're starting to introduce require a three-phase feed. We wanted to relate our energy consumption to real mileage and commercial output and approached Energeno as experts in this field. We pride ourselves on providing a 100 per cent emission-free transportation service and through our work with Energeno, we can further demonstrate our commitment to our environmental responsibility."
